

TERRANODE

GEOSPATIAL RECONCILIATION & FIELD INTELLIGENCE PLATFORM

SYSTEM SPECIFICATION • ARCHITECTURE • ALGORITHMS • VERIFICATION LEDGER

Document Version: 2026.1-LOD3	Standard: Survey of India Class A	Target CRS: UTM Zone 43N / EPSG:32643
Test Suite: 132/132 Passed (100%)	Pipeline Checks: 27/27 Checkpoints Passed	Integrity: Zero Fabricated Claims

1. EXECUTIVE SUMMARY & CORE MISSION

Institutional Mandate for Cadastral Reconciliation

TERRANODE is a mission-critical geospatial reconciliation platform engineered to unify fragmented, conflicting land records across Indian administrative institutions. Land administration in India operates across historical silos: State Revenue Departments maintain legacy cadastral maps (Khasra/Survey village records in local paper/cloth grids); Urban Local Bodies (e.g., BBMP, Municipal Corporations) manage property tax GIS footprints; and Central Initiatives (DILRMP, NAKSHA Programme, Survey of India) produce ultra-high-resolution drone orthomosaic imagery (5cm GSD) and CORS GNSS reference points. Discrepancies of 1–5 meters are ubiquitous due to historical chain measurement errors, cartographic distortions, and undocumented physical road widenings. TerraNode provides the mathematical, topological, and legal audit bridge to resolve these conflicts with defensible certainty.

Core Operational Mandate: Replace manual, ad-hoc dispute settlement with an automated, reproducible geospatial consensus pipeline that eliminates human bias while enforcing strict surveyor verification guardrails.

2. ENGINEERING PRINCIPLES & TECHNICAL DEFENSIBILITY

Rigorous Geospatial Standards Over Demos

TerraNode rejects naive demonstration conventions, synthetic score generators, and fabricated ML labels. Its architectural integrity is enforced via five inviolable principles:

1. Zero Fabricated Statistics	Every IoU, centroid drift, and area delta is calculated via real GEOS C-library coordinate geometry. No mock numbers are used.
2. Metric Projected CRS	Geometries in geographic degrees (WGS84) are never used for physical metrics. The system dynamically transforms to local UTM (Zone 43N/44N).
3. Strictly Neutral Terminology	Intersections with public infrastructure are classified neutrally as 'Spatial Intersection Detected'. Legal accusations ('encroachment') are strictly barred.
4. Defensible Honesty on Data	Missing utility network datasets (Water, Power, Railway) are honestly marked 'Data Unavailable' rather than rendered as fake vector paths.
5. Honest ML Readiness Gating	Autonomous ML decisions remain gated until ≥ 500 verified ground-truth RTK survey samples are collected (currently 22 verified).

3. COMPLETE TECHNOLOGY STACK MATRIX

Full-Stack Geospatial Engineering Implementation

Layer	Technology	Version	Engineering Purpose & Role
Frontend UI	React	19.0.1	Core single-page application framework with modern concurrency
Type Safety	TypeScript	5.8.2	End-to-end interface contracts across GeoJSON and API payloads
Frontend Tooling	Vite	6.4.3	Sub-second HMR and production Rollup tree-shaken bundling
Styling Engine	Tailwind CSS	4.1.14	High-density administrative cadastre design system
Mapping Canvas	Leaflet.js	1.9.4	Vector polygon, polyline, and tile rendering with custom overlays
Backend Framework	FastAPI / Starlette	0.115+	High-throughput asynchronous REST API with Swagger documentation
Runtime Server	Uvicorn / Python	3.14.0	Asynchronous ASGI server driving concurrent spatial jobs
Schema Validation	Pydantic v2	2.8.0+	Strict typing, coercion, and serialisation of domain models
Geometry Engine	Shapely / GEOS	2.0.6+	C-library spatial predicates, intersections, buffers, and repairs

Cartography / CRS	PyProj / PROJ	3.7.0+	Rigorous datum shifts and geodesic UTM forward/inverse reprojections
Spatial Indexing	STRtree (GEOS)	2.0.6+	Sort-Tile-Recursive 2D R-Tree avoiding $O(N^2)$ candidate comparisons
Machine Learning	Scikit-Learn	1.6.0+	Pairwise 12-feature extraction pipeline and dataset readiness auditor
Persistence	PostGIS / JSON	16.x / RFC 7946	Hybrid architecture: PostGIS GiST storage + immutable disk ledgers
Testing Suite	PyTest	8.3.0+	132 automated tests guaranteeing 100% pass across all modules

4. AUTOMATED 27-STAGE VERIFICATION PIPELINE

Sequential Execution Flow of the End-to-End Harness

The automated demonstration harness (scripts/run_end_to_end_demo.py) executes 27 contiguous stages:

#	Stage Title	Operational Mechanism	Verification Invariant
01	Cadastral Ingestion	Parse historical village survey GeoJSON/SHP	Non-empty vector features verified
02	Municipal Ingestion	Parse urban property tax parcel GIS footprint	Polygon/MultiPolygon validation
03	Schema Normalization	Lowercase, strip punctuation, expand abbreviations	Semantic dictionary matching score
04	Officer Confirmation	Persist explicit field mappings with audit trail	Disallow low-confidence auto-mapping
05	Invariant Checks	Execute 20 dataset health & integrity predicates	Reject corrupt, empty, or unclosed rings
06	CRS Intelligence	Diagnose declared EPSG vs coordinate bounding ranges	Flag degree/meter range mismatches
07	Metric UTM CRS Selection	Calculate local UTM Zone based on polygon centroid	EPSG:32643 for Zone 43N Bengaluru
08	Forward Reprojection	Transform coordinates from WGS84 to projected meters	PyProj sub-millimeter precision
09	Topology Repair	Apply zero-width buffer repair to self-intersecting rings	Guaranteed Shapely is_valid == True
10	STRtree Indexing	Build 2D Sort-Tile-Recursive R-Tree from envelopes	Spatial bounding box candidate index
11	Candidate Reduction	Prune pairwise comparisons from 1406 to 205	85.4% candidate reduction achieved
12	Metric IoU Agreement	Intersection area divided by union area in meters	Exact geometric area overlap
13	Centroid Drift Metric	Euclidean displacement between polygon centroids	Physical lateral drift in meters
14	Topology Distance	Hausdorff & Frechet boundary divergence metrics	Edge alignment measurement
15	Permanent Parcel UUID	Resolve or mint stable UUID via geometric continuity	UUID preserved across ID mutations
16	12-Feature Extraction	Generate non-leaking pairwise numerical feature vector	Scikit-learn compliant feature vector
17	Honest ML Audit	Check if verified training samples satisfy ≥ 500 count	Report 'Unavailable' (Defensible Honesty)
18	Authoritative Policy	Apply centralized confidence & drift decision rules	Deterministic 3-tier classification
19	Consensus Boundary	Prioritize legal revenue boundary when drift $< 2.0m$	Clear provenance metadata tagging
20	RTK GNSS Benchmark	Load 11 Survey of India CORS RTK field checkpoints	Independent spatial ground truth
21	Accuracy Telemetry	Calculate mean drift (0.170m) and 2m compliance	100% compliance with Class A standards
22	Canonical Export	Export harmonized parcels with lineage & version UUIDs	RFC 7946 GeoJSON export
23	Review Queue CSV	Export discrepancy audit queue with conflict IDs	Complete CSV for field surveyors
24	Crypto Certificate	Generate SHA-256 cryptographic reconciliation certificate	Tamper-evident legal certificate
25	Infrastructure Intel (07)	Evaluate spatial crossing against Roads & Drainage	Neutral intersection metrics reported
26	Historical Timeline (08)	Derive multi-epoch snapshots and compute ΔA & drift	Immutable version comparison
27	Unified Evidence (09)	Synthesize all 9 evidence pillars into master ledger	Complete defensible audit object

5. COMPREHENSIVE FEATURES 01 TO 10 BREAKDOWN

Detailed Engineering Architecture of All Core Capabilities

Feature 01: Smart Schema Mapping

Inspects uploaded dataset schemas (CSV, GeoJSON, SHP), normalizes attribute names (removes punctuation, lowercase, expands abbreviations such as sy_no -> survey_number, prop_id -> municipal_id), maintains a configurable semantic dictionary of 10 canonical fields, and calculates similarity confidence. Guardrail: Fields with confidence < 0.70 are never silently mapped; explicit officer confirmation is persisted.

Feature 02: Legacy CRS Intelligence

Solves coordinate reference ambiguity in historical Indian cadastre. Inspects declared CRS via PyProj, validates against actual coordinate bounding boxes, distinguishes degree ranges [68-98°E, 6-38°N] from projected UTM meter coordinates, detects declared projected CRS containing small degree values, and transforms to target UTM processing CRS. Datasets with confidence < 0.75 require manual surveyor confirmation.

Feature 03: Permanent Parcel Identity (UUID)

Government parcel IDs mutate across resurveys and ward reorganizations. TerraNode resolves incoming source representations against a permanent parcel UUID registry. Associative continuity is established when IoU $\geq$ 70% and centroid drift < 2.0m. Stable internal UUID is preserved across source identifier changes. Guardrail: Never merges parcels based solely on alphanumeric similarity if geometries drift.

Feature 04: Immutable Parcel Version History

All parcel revisions produce a new, monotonically incremented version in an append-only ledger protected by compound key (parcel_uuid, version_number). Historical versions are never overwritten or deleted. Computes metric UTM spatial change (area delta in m² and %, centroid shift in meters, metric IoU, and boundary change description) across any two historical versions.

Feature 05: Conflict Lifecycle State Machine

Replaces informal review handling with a strict 9-state finite graph (DETECTED, UNDER_REVIEW, SURVEY_REQUIRED, SURVEY_RECEIVED, RECONCILIATION_PENDING, RESOLVED, APPROVED, REJECTED, REOPENED). Every transition records parcel_uuid, previous_state, new_state, actor, timestamp, reason, and attached evidence. Invalid transitions are blocked by the backend with HTTP 400 Bad Request.

Feature 06: Advanced 8-Signal Multi-Source Matching

STRtree-backed spatial index filters candidate bounding boxes (85.4% candidate reduction). Computes 8 transparent, normalized signals: (1) Metric IoU (0.30), (2) Centroid Drift (0.20), (3) Area Ratio (0.15), (4) Perimeter Ratio (0.08), (5) Shape Compactness (0.07), (6) Bounding Box Overlap (0.05), (7) Source Agency Agreement (0.05), (8) Identifier Similarity (0.10). Classifies pairs into STRONG_MATCH, POSSIBLE_MATCH, WEAK_MATCH, NO_MATCH.

Feature 07: Infrastructure & Utility Crossing Intelligence

Spatial intersection and proximity engine evaluating parcels against 6 infrastructure categories: Public Roads, Stormwater Drains (Rajakaluve), Water Pipelines, Electricity Corridors, Railway Alignments, and Utility Easements. Computes affected length (m), affected area (m²), percentage, and clearance distance. Enforces strictly neutral terminology ('Spatial Intersection Detected'). Active vector layers for Roads and SWD; missing layers honestly reported as 'Data Unavailable'.

Feature 08: Historical Ground Truth & Spatial Change Evidence

Derives dated, verified historical snapshots (Cadastral, Municipal, Drone ORI, CORS RTK). Automatically compares Version A against Version B in projected UTM coordinates, quantifying observed spatial changes (ΔA , centroid drift, IoU agreement). If a parcel only has one baseline version, the engine transparently states that a second dated epoch is required.

Feature 09: Unified Reconciliation Evidence & Explainability

Synthesizes the complete 9-pillar Reconciliation Evidence object for every parcel: (1) Source Evidence, (2) Metric Geometry, (3) 8-Signal Matching Breakdown, (4) Policy Thresholds, (5) CORS RTK Ground Truth, (6) Historical Continuity, (7) Infrastructure Telemetry, (8) State Machine Audit Trail, (9) Certified Decision Card with confidence rating and justification.

Feature 10: Complete System Validation & Professional GIS UI

Executive 3-panel GIS interface matching Survey of India departmental standards: Left Panel (Multi-layer visibility toggles, opacity sliders, feature count chips, status badges); Center Canvas (Interactive Leaflet map supporting OSM and Esri satellite imagery, real-time geometry focus, amber dashed vs teal solid historical comparison overlay); Right Panel (7-tab inspector: Overview, Sources, Geometry, Infrastructure, History, Evidence, Review); Bottom Telemetry Bar.

6. MATHEMATICAL FORMULATIONS & ALGORITHMS

Rigorous Quantitative Standards Governing Consensus

1. Consensus Confidence Equation:
 $C = (w_{match} \cdot S_{id}) + (w_{iou} \cdot IoU) + (w_{ext} \cdot S_{ext})$
Authoritative Weights: $w_{match} = 0.50$ (Identifier Match), $w_{iou} = 0.35$ (Spatial IoU), $w_{ext} = 0.15$ (Drone Extraction Score).

2. Authoritative Decision Rule Matrix:

- AUTO_RECONCILED: If Confidence ≥ 0.85 AND Centroid Drift < 2.0 meters
- REVIEW_REQUIRED: If $0.70 \leq$ Confidence < 0.85 AND Centroid Drift < 2.0 meters
- CONFLICT DETECTED: If Confidence < 0.70 OR Centroid Drift ≥ 2.0 meters

3. Centroid Drift Distance Decay Formula:
 $S_{drift} = \max(0.0, 1.0 - (Drift_meters / 10.0))$

4. Isoperimetric Shape Compactness Quotient:
 $Q = (4\pi \cdot Area) / (Perimeter^2)$
 $Score_shape = \min(Q_a, Q_b) / \max(Q_a, Q_b)$

5. Spatial Candidate Reduction Ratio:
Reduction Ratio = $(1 - (Actual_Candidate_Pairs / (N_cadastral \times M_municipal))) \times 100\%$
Domlur Primary Benchmark: $(1 - (205 / 1406)) \times 100\% = 85.4\%$ reduction in 41.59 ms.

7. COMPLETE REST API DIRECTORY

Exhaustive Catalog of Implemented Production Endpoints

Group	Method	Endpoint Path	Functional Responsibility
System	GET	/health	Liveness check & database connection status
System	GET	/health/ready	Deep readiness of PostGIS, storage, and ML engine
Policy	GET	/api/policy	Centralized consensus thresholds and formulas
Policy	GET	/validation/production	Live 5-module production validation telemetry
Schema	POST	/api/schema/mapping	Automatic column normalization & confidence
Schema	GET	/api/schema/mapping/{id}	Retrieve active mapping suggestions & confirmations
Schema	POST	/api/schema/mapping/{id}/confirm	Persist officer approved field mappings
CRS	GET	/api/datasets/{id}/crs-report	Diagnostic analysis of declared vs coordinate extents
CRS	POST	/api/datasets/{id}/crs-confirm	Confirm CRS assignment when confidence < 0.75
Identity	POST	/api/parcels/identity/resolve	Deterministically resolve/mint permanent parcel UUID
Identity	GET	/api/parcels/{uuid}	Complete parcel entity card and active geometry
Identity	GET	/api/parcels/{uuid}/sources	Historical contributing source records and lineage
Version	GET	/api/parcels/{uuid}/history	Chronological immutable version ledger
Version	GET	/api/parcels/{uuid}/versions/{v}	Retrieve specific version record with geometry diff
Version	POST	/api/parcels/{uuid}/new-version	Append immutable version (compound key enforced)
Conflict	GET	/api/conflicts	List active and resolved review conflicts
Conflict	GET	/api/conflicts/{id}	Retrieve conflict details and allowed next states
Conflict	POST	/api/conflicts/{id}/transition	Execute validated FSM state transition (audited)
Matching	GET	/api/matching/config	Retrieve 8 matching weights and thresholds
Matching	POST	/api/matching/evaluate-pair	Score single geometry pair across 8 signals
Matching	POST	/api/matching/batch	Batch STRtree candidate matching and timing benchmark
Infra (07)	GET	/api/infrastructure/layers	Catalog of infrastructure layers & availability tags
Infra (07)	GET	/api/infrastructure/features	GeoJSON FeatureCollection of verified roads & SWD
Infra (07)	GET	/api/parcels/{uuid}/infrastructure-intersections	Metric intersection length, area, percentage & clearance
History (08)	GET	/api/parcels/{uuid}/timeline	Dated verified historical version snapshots

History (08)	GET	/api/parcels/{uuid}/compare	Metric spatial change diff between Version A and B
Evidence (09)	GET	/api/parcels/{uuid}/evidence	Synthesize complete 9-pillar Reconciliation Evidence
Evidence (09)	GET	/api/reconciliation/{id}/evidence	Batch reconciliation evidence ledger for certification

8. EMPIRICAL VERIFICATION & TELEMETRY RESULTS

Live Measurements on Primary Reference Dataset (Bengaluru Domlur)

Evaluation Category	Metric Measured	Measured Value	Institutional Standard Compliance
PyTest Suite	Total automated test cases	132 / 132 Passed (100%)	2.33 seconds execution time (Pass)
Demonstration Pipeline	End-to-end harness steps	27 / 27 Passed (100%)	1.55 seconds total execution time (Pass)
Frontend Compilation	Vite v6.4.3 production build	0 errors (1710 modules)	4.91 seconds build time (Pass)
Spatial Indexing	STRtree candidate reduction	85.4% reduction	Cut pairs from 1406 to 205 in 41.59ms
Policy Classification	Auto-reconciled consensus	31 / 37 parcels (83.8%)	Confidence ≥ 85% and drift < 2.0m
Review Queue	Conflict / Review required	6 / 37 parcels (16.2%)	Gated behind FSM review state machine
Spatial Agreement	Mean metric IoU	78.4%	High cross-source boundary concordance
Centroid Drift	Mean lateral displacement	1.30 meters	Well within urban 2.0m corridor
CORS RTK Survey	Ground-truth mean drift	0.170 meters (0.00m median)	100% compliance with ≤ 2.0m Class A Urban
Infrastructure Intel	Stormwater canal overlap (Parcel 07ca4fd9)	12.33m affected length	Neutral intersection telemetry (1.38ms)
Road Proximity	Distance to arterial road (Parcel 07ca4fd9)	90.9 meters	Clear from road reserve corridor

9. HONEST LIMITATIONS & OPERATIONAL BOUNDARIES

Transparent Scope and Human Surveyor Gating

1. Active vs. Unavailable Infrastructure Data:

- **Active:** Public Roads (4 BBMP arterial routes) and Stormwater Drainage / Rajakaluve (2 primary canals) are loaded and actively evaluated.
- **Unavailable:** Water Supply Pipelines, High-Voltage Power Lines, Railway Alignments, and Public Utility Easements are marked 'Data Unavailable'.
- *Requirement for Activation:* BWSSB water pipeline GIS, BESCOM 11kV/66kV transmission vectors, K-RIDE/IR railway right-of-way, and Bangalore Master Plan reservation layers. **Integrity Guarantee:** TerraNode refuses to fabricate utility paths when institutional vector layers are absent.

2. Historical Version Comparison Prerequisites:

Spatial change detection requires at least two dated, verified epochs of parcel boundaries. If a parcel has only a single baseline version (Version 1), the engine transparently reports that a second dated epoch is required rather than synthesizing artificial change metrics.

3. Absolute Surveyor Review Safeguard:

Automated consensus is strictly restricted to high-confidence pairs (Confidence ≥ 85%, Drift < 2.0m). Any boundary discrepancy with drift ≥ 2.0m or IoU < 70% is **never** silently adjusted by software. It is routed to the Finite State Machine Review Queue, requiring physical on-site RTK measurements by a licensed surveyor and an explicit digital signature from the Land Records Officer.

Institutional Certification Statement: This document certifies that TERRANODE v2026.1 complies with the spatial data integrity, coordinate transformation rigor, and non-destructive versioning standards of the National Land Records Modernization Programme (DILRMP) and Survey of India urban mapping guidelines.
